

30 DAYS OF CODE (PYTHON TRACK)

Day 11 - Compress the string

Write a function named **compressor** that **takes in a string of numbers as its parameter** and **returns a tuple of tuples** (Each sub tuple is to contain a number in the string as the first element and the number of times it appears as the second element. Both tuple elements are to be integers and there should not be multiple entries.)

N.B: No in-built module should be used.
