30 DAYS OF CODE (PYTHON TRACK)

Day 8 - Hangman Game

This task requires us to give a user N trials to guess all the letters in a word. If the user correctly guesses a letter, print the letter otherwise, print an underscore.
Create a function named **Hangman** that takes in the **secret word and the number of guesses as parameters** and **returns a statement indicating that they won or lost**.

N.B: No in-built module should be used.
