30 DAYS OF CODE (PYTHON TRACK)

<u>Day 12 -Validate email addresses</u>

Create a function that **takes in an email address in string form as its parameter** and **returns a string indicating that it is valid or invalid.** The format for mails goes like:
someone@example.top_Domain
Rules:
Someone: must be in lower case and can only contain alphanumeric, special characters and a single dot.
Example: must be in lower case and only contain alphanumeric and the hyphen.
Top_Domain
The top domain name can contain alphabets and dots only with the caveat that it must end with either 2 or 3 characters after the last dot.

N.B: No in-built module should be used.
